(a) Randomized benchmarking on stressed $H(t)$
Survival probability
Sequence length m (Cliffords)
Calibrated $F_{RB} = 0.9999$
Moderate stress $F_{RB} = 0.786$
Worst-Case stress $F_{RB} = 0.780$
1/d floor ($d = 2$)
(b) RB error r vs D and workload $1 - F_{worst}$
Value
Stress level ($J = A$)
W-state $1 - F_{worst}$
process infidelity D
RB error rate r
Hard Fail ($D = 0.30$)
Calib
Worst
